Cluj, Transylvania. Institutul Politehnic

Buletin filială (electrotehnica) Cluj, Intreprinderea Politehnica, 1959,  
671 P., hărți și cărți, 80, 40 copii printării sunt găsiți. Nu  
există datele de colectare.

PURPOSE: This book is intended for mathematicians, physists, chemists, and  
civil and mechanical engineers.

CONTENTS: The book consists of 29 papers by Rumanian specialists on problems in  
mathematics and technology, particularly mathematics, physics, chemistry,  
mechanics, civil and mechanical engineering. Remarks in Russian and  
French or German are given at the end of each article. Some of the articles  
are accompanied by references. No personalities are mentioned. At the back  
of the book there are 23 references, all Rumanian.

AUTHOR: Pop, Tiberiu E., Engineer

TITLE: Eliminating electrochemical corrosion phenomena in underground long-distance communication installations by electrical-insulating and corrosion-resistant material

PERIODICAL: Telecomunicații, no 2, 1961, 64 - 72

TEXT: The author examines the chemical and electrochemical corrosion phenomena in underground cables and presents some protection methods. Electrochemical corrosion which occurs more frequently than corrosion of any other kind is caused by non-homogeneousness and low electric resistivity of the soil. In Soviet literature soils are classified into five categories according to the specific resistivity of the soil. This classification which was also used for Rumanian soil is shown in table 2. The humidity of the soil is a decisive factor in the life of underground installations. Repeated soaking and drying in the presence of an excess of  $\text{CO}_2$  causes  $\text{PbCO}_3$  and  $\text{CaCO}_3$ , which protect the surface of buried cables and are insoluble in water, to change into bicarbonates, X

which dissolve easily in water. Ground waters, however, whose pH is 7.4 - 7.5 for a hardness of 8 - 10° form lead carbonate. The salt content expedites corrosion but  $\text{SO}_4^{2-}$  and  $\text{SiO}_3^{2-}$  ions in the soil retard the corrosion process by forming an impermeable layer of lead silicates or sulfates. The pH-value of soil and water is another corrosion factor: if below 6.5, it indicates greater soil acidity and if over 8.5 it can cause corrosion in underground cables, even in the cathode zones of soils with strong alkaline characteristics. It has been found that in cables with a protective wrapping of creosote-impregnated jute between the lead sheath and the armor the lead corrodes, and the jute partially decomposes. The analysis showed that lead corrosion was due to the presence of phenols. Research conducted recently proved that ground waters have the same nitrate content as the Heller solution consisting of 200 g lead acetate + 100 cu cm nitric acid ( $d = 1.16$ ) and 1,000 cu cm distilled

water, in a concentration of 1:1,000 and that the  $\text{NO}_3^-$  ion plays a decisive role in corrosion of underground cables caused by phenols. Buried metal structures are protected from corrosion by insulation between them and the surrounding soil. Good insulation of the lead sheath and armor can be obtained by various plastic layers preventing humidity penetration and offering good resistance to the electric current. The corrosion-inhibiting efficiency of these layers depends on their thickness. The pH-index, the resistivity of the soil and the current density are necessary factors when establishing the aggressiveness of soil and selecting the insulating material. The pH-index is measured by a Merck universal indicator and the resistivity of the soil by the four-electrode method, using an "MC-07" magneto-electric ratiometer made by "Energopribor". Current density is measured by the "lead electrode" method, i.e. by a 1-m-long lead rod in parallel connection with the cable, at a distance of 5 - 10 cm. Pure lead and lead alloys with antimony, bismuth,

D019/D105

Eliminating electrochemical corrosion phenomena in underground long-distance communication installations by electrical-insulating and corrosion-resistant material

copper, tellurium and thallium are used in the production of cable sheaths, since they are highly resistant to atmospheric corrosion attacks. Some overhead cables in industrial towns have a protective PbS film which is not easily soluble in rain water. In some places cables in concrete ducts, the inside of which had not been treated with molten asphalt, were corroded by  $\text{Ca}(\text{OH})_2$ . Since sandy and sandy-clayey soils are not dangerous, river sand

is used when underground cables are installed. Careless handling and shipping of cables produces mechanical deterioration and the formation of oxides, whose presence in the sheaths lowers the resistance to corrosion since some of these oxides are easily dissolved by electrolytes in the soil. Coating cables with a layer of mineral oils is another method of protection. Non-armored cables buried in the soil are insulated by bitumen tape at  $180^\circ\text{C}$ , although after a certain period of time this insulation is attacked and destroyed by bacteria, fungi and various insects. In case of soil, in which electrochemical corrosion

Eliminating electrochemical corrosion phenomena in underground long-distance communication installations by electrical-insulating and corrosion-resistant material

may be expected, the cables should be insulated by 100 - 200-mm-wide glass-cloth strips coated with a mixture of paraffinic hydrocarbons and a polarizing substances consisting of 2% copper naphthenate for the countries of Central Europe, or 2% copper naphthenate and 0.2% "tenil" mercury naphthenate for subtropical countries. Efforts were recently made to use plastic sheaths instead of lead ones in cables with a limited number of circuits. Although plastic-insulated cables are resistant to chemical and electrochemical corrosion, they are easily destroyed by certain fungi under certain conditions. The principle of cathodic protection of underground-cable sheaths is the production of a negative potential. This negative potential is obtained by (1) electric drainage, (2) direct-current source established between the protected cable sheath and the soil, and (3) a special electrode connected by an insulated conductor to the lead sheath. Most of the types of corrosion protection of cables dealt with in this work were reported from the Timisoara region. There are 4 tables, 7 figures and 8 references: 7 Soviet bloc and 1 non-Soviet-bloc.

Title : The Significance of Fructose and Citric Acid Content in the Sperm.

Orig Pub : Bul. Sciint. Acad. R.P. Romine. Sec, Biol. Agron. Geol. si Ge gr., 1955, 7, No 4, 1167-1172

Abstract : The bull's sperm contains 171-606 mg percent of fructose, 375-1045 mg percent reproductive substances, 107-304 mg percent of citric acid. The stallion's sperm contains correspondingly less of these substances: 3.5 from 26 to 171, and 15 to 62.5 mg percent. In poorly fed animals or exhausted by excessive use, the quantity of these substances in the sperm is reduced. The determination of content in these substances in the sperm gives an indication of the quality of the sperm and of the physiological state of the animals. A micromethod for the determination of fructose and citric acid in the sperm is described.

Variation of the catalase activity and of the citric acid content in some medicinal plants at the different stages of vegetation. L. M. Burulan, V. Pop, E. Pop, and L. Popa. Acad. rep. populară Române Baza cercetării, științe, Timișoara, Studii cercetării, ştiințe, 3, No. 1-2, 67-77 (1958). — The catalase activity and its energy of activation and the citric acid content of 6 medicinal plants were studied at different stages of vegetation. In the leaves the catalase present increases at the beginning of the flowering season, and then decreases. The quality of the enzyme varies inversely. The amt. of citric acid increases continuously, chiefly after the flowering season. In the stalk the process is the same, but for the citric acid content, which increases during flowering and diminishes after. Martha Arcos

Title : Fluorescence Spectra of Kerosenes

Orig Pub : An. stiint. Univ. Iasi., 1956, Sec. 1, 2, No 1-2, 199-210

Abstract : Four grades of kerosenes were investigated. In three-minute photography on the E31 Hilger spectrograph there was observed fluorescence in the region of 3200-4600 Å. The glow in the region of the wave lengths longer than 3700 Å, due to the presence of polycyclic compounds (principally anthracene) is observed in kerosenes that were distilled to high temperatures. Kerosene distilled to 272° C practically does not glow in this region. When the kerosenes are diluted in ether, the fluorescence in the region of wavelengths greater than 3700 Å vanishes rapidly. But at the same time there appears and also vanishes a glow in the region  $\lambda < 3200$  Å. At greater dilutions, one observes only the fluorescence in the region 3200-3700 Å.

TITLE	: Fluorescent Fractions of Diesel Fuel from Rumanian Petroleum.	
ORIG. PUB.	: An. stiint. Univ. Iasi, Sec.1, 1957, No 1-2, 243-256	
ABSTRACT	: Study of fluorescence spectra of Humanian petroleum fractions boiling in the range of 240-350°. Excitation was effected with total light of mercury lamp. Spectra were photographed using quartz spectrograph. Photographs were made of spectra of the fractions, as well as of their solutions in ether, at concentrations from 10 to 0.001%. Spectra of fractions and of their solutions are in the 300-550 m $\mu$ region. The conclusion is reached that luminescence is caused by presence of naphthalene, phenanthrene, anthracene, and their homologues.

Title : Fluorescence of Motorines of Rumanian Oil

Orig Pub : An Stiint. Univ. Lasi. Soc. I., 1957, 3, № 1-2, 243-256

Abstract : An analysis of the fluorescence spectra of pure samples  
of motorines  $\Lambda_1$  special,  $\Lambda_1$ ,  $\Lambda_3$  and  $\Theta$  and their solutions  
in ether has shown that the fluorescence of the motorines  
is caused principally by the naphthalene, phenanthrene,  
and anthracene, and to a lesser extent by their homolo-  
gues. The fluorescence spectra of motorine  $\Theta$  differ con-  
siderably from the spectra of the remaining motorines  
(which are similar to each other), this being explained  
by the greater content of anthracene and its homologues.

TITLE: Fluorescence Spectra of Motor Fuels (Spektry fluorescentsii  
motorinov)

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1959,  
Vol 23, Nr 1, pp 122 - 125 (USSR)

ABSTRACT: This paper describes the results obtained by an investigation carried out by the authors (Romania) of the fluorescence of motor fuels extracted from Romanian mineral oil. Four substances  $A_1$  special,  $A_1$ ,  $A_3$ , and C were investigated, the properties of which are given by a table. The spectra (Fig) of the first three samples differ only little from one another. The  $\lambda$ -values of the maxima are given. With sample C matters are somewhat different. The most important maxima are shifted into the long wave range. Also the microphotographs of solutions of the four samples in ethyl ether of various concentrations are given by a figure. For the purpose of determining the substances contained in the motor fuels, comparative pictures were made of the absorption spectra of naphthalene,

Card 1/2

Fluorescence Spectra of Motor Fuels

SOV/48-23-1-27/36

phenanthrene and anthracene (Fig 3). The results obtained by these investigations show that the formation of motor oil spectra is mostly due to naphthalene, anthracene, and phenanthrene or to other similar luminescent compounds. In the presence of many luminescent compounds the comparative investigation method is not very well suited. Therefore, the luminescence spectra of a fraction of the motor fuel C were, in addition, investigated according to 10 percent of volume. The first four fractions differ only little from one another and correspond to the naphthalene-, phenanthrene, and anthracene spectra. In the case of others, intensities are shifted to a considerable extent into the long-wave range. Individual maxima and their variation are mentioned individually. On the basis of the fluorescence spectra of the fractions, the authors arrive at the conclusion that the motor fuels naphthalene, phenanthrene and anthracene investigated by them contain quantities which decrease in this order. There are 4 figures, 1 table, and 7 references, 4 of which are Soviet.

"Observations on Some Indices Regarding the Inheritance of Wool Properties in the Cross Breeding of Sheep."

Bucharest, Revista de Zootehnica si Medicina Veterinara, Vol 16, No 10, Oct 66, pp 19-22.

Abstract: The report concerns a project for the obtaining of a breed of sheep with semifine wool especially suited for the pedoclimatic conditions of the Cluj area by crossing local Tigaie and Turcana sheep with various Merino strains. Results are given relating to the production and characteristics of offspring , and the inheritance and genetic gain with regard to the desired characteristics are calculated. The reported results, for the years 1960-64, indicate that the project is aiming in the right direction and should be expanded.

✓ The ultraviolet yield of a discharge in air. Ion Ascriber  
George Nicolai Sturz, Ariana Popa, and Ion Vrinceanu  
Bull. Inst. Politehnica Bucuresti 1957. — The ultra-  
violet yield of a discharge in air was studied at low and high  
frequencies in a glass capillary 60 mm. long and 4 mm. in  
diam. The discharge tube was patterned after Weitner  
(C.A. 48, 6234c) and had 2 circular Al electrodes. At low  
frequencies, the air pressure varied between 0.1 and 27 mm.,  
the current, between 0 and 14 mA., and the applied poten-  
tial, between 30,000 and 34,000 v. In the pressure range  
from about 0.32 to 21.5 mm. the yield was approx. const.  
with values from 0.42 to 0.48; at pressures below 0.22 mm.  
the yield decreased rapidly, while above 21.5 mm. the dis-  
charge was unstable. The work at high frequencies, be-  
tween 10 and 45 Mc., was carried out at air pressures be-  
tween 0.3 and 2.66 mm., a const. current of 0.01 mA., and at  
an applied potential of 600 v. Under these conditions the  
yield increased slightly from 0.204 to 0.210 and can be  
considered identical to the low-frequency results. An ex-  
planation of the data is attempted. B. Alexander Stern

A study to obtain active carbon from different industrial residues. I. Conditions to obtain active carbons and their behavior. V. Ababi, Angela Popa, and Julian Gabe. *Acad. rep. populares Române* (1951), *Sinăuții cercetării științ. 3*, 143-58 (1952).—Expt's with residues from alcohol, beer, and sugar factories and with acorn husk were carried out to obtain active C. After obtaining the crude C, the optimum conditions for its activation and the corresponding isotherms of absorption were detd. Temp. and length of carbonization

depend on the starting material, but the most favorable conditions are at 700-800° and 4-6 hrs. for carbonization. The activation of the carbon also depends on the raw material having its optimum at 800-50°, and the best quality of C requires between 0.5 and 1 hr. The isotherms of absorption detd. indicate the capacity of the different carbons obtained.

✓ Adsorption phenomena on activated carbons prepared from industrial refuse. V. Ababi and Angela Popa. *Analistic Univ., "Al. I. Cuza," Iasi, Sci. T.N.S.T.*, No. 1-2, 353-68 (1955).—The carbons were obtained from the residues of beer breweries; such residues were treated at various temps. Some were also activated by adding ZnCl<sub>2</sub>, K<sub>2</sub>CO<sub>3</sub>, or KCNS. The various carbons obtained were tested for adsorptive properties with aq. solns. of org. acids, phenol, methylene blue, or Congo red. A carbon that was heated to 800° during its prepn. for a short time only, without any addns., was the best, as it contained small pores mostly. The effect of the ash was also studied; it complicates the adsorption by blocking (mechanically) the pores and by entering into reactions with the materials to be adsorbed. Activation and adsorption and desorption behavior of activated carbons from domestic [Romanian] nut shells. *Ibid.* 353-58.—Here too by varying temps., times, and addn. of activating agents carbons of various activities and porosities can be obtained. For walnut shells it was found that H<sub>3</sub>PO<sub>4</sub> or K<sub>2</sub>CO<sub>3</sub> produced the best carbons with small pores, which adsorbed even gases and small-sized mols., such as AcOH and I<sub>2</sub>. Various adsorption and desorption curves are presented for solvents, such as EtOH over KCl solns., also for KI, in addn. to pure H<sub>2</sub>O. W. J.

Title : Study of Regeneration of Activated Carbons from Gas  
Masks

Orig Pub: An. stiint. Univ. Iasi., 1956, Sec. 1, 2, No 1-2, 291-310.

Abstract: The methods of regeneration of activated carbons (UAC) from gas masks used up in a factory producing Cl were studied. It was found that a treatment of UACs with steam at 700 - 950° raised their adsorption capacity from 728.2 mg of iodine per 1 g to 1888 mg. It was established based on the obtained adsorption isotherms that the duration of the steam treatment influenced the

I. Esterification of Rosin With Pentaerythrite\*  
ORIG. PUB. : An. stiint. Univ. Iasi. Sec. I., 1957, 3, No 1-2,  
399-421  
ABSTRACT : Rate of the esterification reaction at temperatures ranging from 240 to 300° was investigated together with the effects of alcohol excess (based on the ratio to abietinic acid) and several catalysts. It was established that the optimum temperature of esterification with pentaerythrite (I) is 300° and that with d-mannite (II) is 280°. An acid excess tends to hasten the reaction, however, the end products contain greater number

\*and d-Mannite

POPA, A.

The study of the esterification of colophonium with poly-alcohols. II. The esterification of transformed colophonium with pentaerythritol and D-mannitol. V. Ababi and A. Popa. *Analyst (Lond.)*, 1958, **81**, 1019-24 (1958); *J. Polym. Sci.*, **33**, 210-34 (1958); *J. Polym. Sci.*, **33**, 10196. — The esterification reaction of isomerized colophonium (I) depended on its isomerization temp. I isomerized at 200° was esterified by D-mannitol much more readily than when isomerized at 280°. Esterification of polymerized I with polyalcohols gave final products with less acidity than when untransformed I was esterified. With pentaerythritol the acidity between the two varied from 10.44 and 12.63 mg. KOH/g. to 24.34 mg. KOH/g. Polymerized I was esterified by D-mannitol less than 70% and by pentaerythritol more than 90%. Of Co<sub>3</sub>O<sub>4</sub>, Mo<sub>3</sub>O<sub>6</sub>, WO<sub>3</sub>, and Cr<sub>2</sub>O<sub>3</sub>, only the last one enhanced the esterification reaction while the others had a neg. influence. The degree of esterification of fumaric adducts of I with D-mannitol was much higher than that at the maleic adduct but after 6 hrs. the acidity of the product was still over 40 mg. KOH/g. Polycondensation of adducts of I with maleic anhydride and fumaric acid with pentaerythritol gave insol. and infusible macromol. products. Fumaryl derivs. gave quicker polycondensation than maleic derivs. The speed of polycondensation was also directly dependent on the temp. By esterification at relatively low temp. in the presence of excess alcohol products with high HO index were obtained, which had a high m.p. and gave very viscous solns. M. P.M.

Title : Nervo Apparatus of the Periosteum of the Lower Human Jaw

Orig Pub : Kishinevsk. med. in-ta, 1956, 5, 277-283

Abstract : The source of innervation of the periosteum of the lower jaw is the same nerve tracts which supply muscles, joints and others (mental nerve). Fibers penetrate into the periosteum from muscles in the areas of their attachment. Nerve trunks in the periosteum split in layers. Orientation of the nerve fibers depends on the direction of the fibrous grain. A large number of fibers possess perinural sheaths which break or pass into a layer of an external capsule (with unencapsulated terminations). In the nerve trunk, there are both pulpal and non-pulpal fibers. Nerve terminations in the periosteum of the lower jaw have a different form and construction.

AUTHORS: Popa, B., Professor, and Killman, V., Dozent

TITLE: Cooling of the Housings of Rolling Bearings Operating under the Conditions of a High Ambient Temperature  
(Okhlazhdeniye korpusov podshipnikov kacheniya, rabotayushchikh v usloviyakh vysokikh temperatur vneshney sredy)

PERIODICAL: Vestnik Mashinostroyeniya, 1959, Nr 4, pp 20-25 (USSR)

ABSTRACT: A plummer block incorporating a self-aligning barrel roller bearing is shown (Fig 1) with a water cooling jacket in the bearing housing. The amount of heat to be carried away by the cooling water is computed from elementary considerations with evaluations of the heat transfer coefficients and the proportion of the heat flow scattered through the remainder of the bearing (one third). When the bearing is heated by the shaft, water or air cooling of the shaft is sometimes used (Fig 3). Cooling discs can isolate a bearing effectively. A set of discs with radial vanes facing each other is also illustrated (Fig 4). Further design details of fan type discs are given which create an air circulation. A family of curves (Fig 7) obtained

Card 1/2

SOV/122-59-4-3/28

Cooling of the Housings of Rolling Bearings Operating under the  
Conditions of a High Ambient Temperature

experimentally is used to find the shaft temperature  
behind the cooling disc and the bearings. Under hot  
conditions, only bearings with an increased radial  
clearance are usable. Grades of clearance are given and  
fits between bearing and shaft recommended.  
There are 7 figures, 1 table and 6 references, of which  
3 are Soviet, 2 German and 1 English.

637 Pg. English translation of original Russian publication, 1959.  
On 2 copies printed not given. 30

PURPOSE: This issue contains 10 Russian specialists on problems in  
level and methods of treatment.

CONTENTS: In this issue there are 10 articles by Russian specialists on problems in  
radiation, physical therapy, electrotherapy, cytology, chemistry,  
pathology, clinical endocrinology, radiology, etc. Some of the articles  
are abstracts from foreign periodicals, some are original. A few articles  
are summaries of Soviet periodicals. All periodicals are mentioned at the back  
of the book.

## TABLE OF CONTENTS

Rybin, V. I. New Developments in the Treatment of Tumors of the Brain. 1959. 457
Sokolova, V. S. Accelerating the Degree of Wear of Machine Tools. 1959. 452
Makarenko, I. New Developments in the Production of Thermal Rays and Methods of Their Application. 1959. 465
Naroz, D. New Developments in the Distribution of the Distribution of Corporations in the USSR. 1959. 479
Milner, E. Radiation Therapy in the Treatment of Throat Diseases. 1959. 486
Pozdnyakov, V. New Developments in the Treatment of Cancer as a Means of Improving the Productivity of Industrial Plants. 1959. 503
Popov, N. New Developments in Chemical Oils. 1959. 521
Perovskii, R. New Developments in the Rehabilitation after Cold Treatment of Diseases. 1959. 529
Kostylev, D. New Developments in the Treatment of Patients with Lung Diseases. 1959. 539
Pupz, B. I. New Developments in the Problem of Bone-Planted Plates 1959. 547
Poplavskii, A. New Developments in Electronic Glass Material. 1959. 559
Prokof'ev, A. New Developments in the Problems of Complex Systems 1959. 567
Rybachko, G. New Developments in Accelerating the Healing of Wounds on Skin of the Head. 1959. 571
Strelcov, B. New Developments in Reducing a High-Frequency Generator. 1959. 577
Burman, A. New Developments in Acousto-Electric Vibrators 1959. 587
Blazquez, J. P. New Developments in Electronic Thermometer 1959. 603
Golosov, A. New Developments in Electronic Vibrometer for Testing the Strength of Materials. 1959. 609
Dobrovolskii, N. New Developments in Synthetic and Plastic Gums. 1959. 615
